

**FOOT AND MOUTH DISEASE
IN THE UNITED KINGDOM
2001**

REPORT NO 5

26 MARCH 2001

**Ministry of Agriculture, Fisheries and Food
26 March 2001**

1. SUMMARY

1.1 An outbreak of Foot and Mouth Disease was confirmed pigs at an abattoir in Essex on 20 February 2001. Laboratory examinations carried at the Institute for Animal Health Pirbright out on tissue samples taken from the affected animals, showed that the virus was FMD type O, Pan Asia strain. This strain has been associated with outbreaks of FMD in Japan, Korea, Russia, Mongolia.

1.2 The total number of confirmed outbreaks of Foot and Mouth Disease in Great Britain currently stands at 606. A single outbreak of FMD was also confirmed in N. Ireland on 1 March 2001.

1.3 The majority of outbreaks have involved sheep destined for slaughter, though disease has been diagnosed in cattle and pigs. In addition to holdings on which disease has been confirmed, animals on 559 holdings considered to be at risk from FMD through contacts with an infected holding, have also been killed. A total of 400,543 animals (98,907 cattle, 297,331 sheep, 234 goats and 4,071 pigs) are affected on the 606 holdings where FMD has been confirmed and 237,054 animals (26,127 cattle, 168,223 sheep, 27 goats and 42,677 pigs) on the 555 holdings considered at risk from FMD.

1.4 On the basis of current epidemiological knowledge, a pig holding in the County of Tyne and Wear is thought to have been the source of the subsequent outbreaks, infection having spread to pig holdings in the County of Essex through the movement of pigs and people and local airborne spread, and to sheep and cattle holdings in the Counties of Tyne & Wear. Thereafter disease spread to other counties in Great Britain and to Northern Ireland through the movement of animals, people and vehicles.

1.5 All the measures foreseen in Council Directive 85/511/EEC have been applied. Protection and surveillance zones with radii of at least 3-km and 10-km have been imposed around each infected holding, the surveillance zones having been extend to take account of the prevailing wind conditions at the time between in the introduction of disease and its first detection.

1.6 On 23 February, The Foot and Mouth Disease Declaratory (Controlled) Area Order 2001 was made making England and Wales a controlled area for the purposes of FMD control and prohibiting the movement of all FMD susceptible animals and their carcasses in the whole of England and Wales except under license and banning the holding of fairs, markets, shows or other gatherings of animals. This Order expired on 2 March and was replaced by The Foot and Mouth Disease Declaratory (Controlled Area)(England & Wales)(No 2) Order 2001 which, while, continuing to prohibit the movement of all FMD susceptible animals and their carcasses in the whole of England and Wales, provides for the movement of animals of any species direct to abattoirs for slaughter. The controlled area was further extended without time limit by The Foot and Mouth Disease Declaratory (Controlled Area)(England & Wales)(No 3) Order 2001 which came into force on 16 March 2001.

TABLE OF CONTENTS

1. SUMMARY
2. POSITION AS AT 26 MARCH 2001
3. EPIDEMIOLOGY
4. FUTURE DIRECTION OF CONTROLS

1.7 On 21 February, Commission Decision 2001/145 (replaced on 1 March by Decision 2001/172 and on 9 March by Decisions 2001/190) came into force and banned the export from the whole of the UK of live animals, germplasm, fresh meat, meat products, milk and milk products, hides and skins of FMD susceptible species. Derogations to the export ban were given for the above commodities subject to the conditions laid down in Decision 2001/145. The ban does not apply to poultry, horses, cats and dogs. It has been implemented through The Export Restrictions (Foot & Mouth Disease) Regulations 2001.

2. POSITION AS AT 26 MARCH 2001

2.1 Current position

2.1.1 The total number of confirmed outbreaks of Foot and Mouth Disease in Great Britain currently stands at 606. A single outbreak of FMD was also confirmed in N. Ireland on 1 March 2001.

2.1.2 The majority of outbreaks have involved sheep destined for slaughter, though disease has been diagnosed in cattle and pigs. In addition to holdings on which disease has been confirmed, animals on 559 holdings considered to be at risk from FMD through contacts with an infected holding, have also been killed. A total of 400,543 animals (98,907 cattle, 297,331 sheep, 234 goats and 4,071 pigs) are affected on the 606 holdings where FMD has been confirmed and 237,054 animals (26,127 cattle, 168,223 sheep, 27 goats and 42,667 pigs) on the 555 holdings considered at risk from FMD.

2.1.3 Confirmed outbreaks have occurred in 31 of the 75 Counties in England, Scotland and Wales. The Counties of Cumbria (228), Dumfries and Galloway (87) and Devon (62) have been particularly affected as have Co. Durham (36), Powys (21) and Tyne and Wear (13), Staffordshire (20), Worcester (18) Hereford (18). The other affected Counties have each had less than 10 outbreaks.

2.1.4 Of the confirmed cases, suspicion of disease was first reported by the owner in 465 instances, by a private veterinary surgeon in 23 instances while 55 outbreaks were detected as a result of tracing from a confirmed outbreak and 36 were detected by MAFF State Veterinary Service staff in the course of patrols in the 3-km protection zones established around all confirmed outbreaks. Thirteen (13) outbreaks were identified in flocks/herds destroyed as dangerous contacts, 8 were detected in abattoirs by the Official Veterinary Surgeon.

2.1.5 A total of 2,657 holding have been placed under official movement restrictions because of suspect FMD. Restrictions have been lifted from 1,407 holding, FMD has been confirmed on 606 holding and the outcome of investigations on 62 holding are awaited. In addition, susceptible species on an additional 557 holding have been killed because they were considered at risk of disease through contact with a holding where FMD had been confirmed.

2.1.6 A map showing the location of confirmed FMD outbreaks in Great Britain is at Annex 1.

2.2 Legislative controls

2.2.1 All the measures foreseen in Council Directive 85/511/EEC have been applied. Protection and surveillance zones with radii of at least 3-km and 10-km have been imposed around each infected holding, the surveillance zones having been extended to take account of the prevailing wind conditions at the time between the introduction of disease and its first detection.

2.2.2 On 23 February, The Foot and Mouth Disease Declaratory (Controlled) Area Order 2001 was made making England and Wales a controlled area for the purposes of FMD control and prohibiting the movement of all FMD susceptible animals and their carcasses in the whole of England and Wales except under license and banning the holding of fairs, markets, shows or other gatherings of animals. Identical legislation was made in Scotland.

2.2.3 This Order expired on 2 March and was replaced by The Foot and Mouth Disease Declaratory (Controlled Area)(England & Wales)(No 2) Order 2001 which, while, continuing to prohibit the movement of all FMD susceptible animals and their carcasses in the whole of England and Wales, provides for the movement of animals of any species direct to abattoirs for slaughter. Local movements (upto 5-km), under license, have also been permitted for welfare or reasons of essential farm operation but these latter movements may not exceed 0.5-km and movements must take place within the boundaries of the same holding

2.2.4 The controlled area was further extended without time limit by The Foot and Mouth Disease Declaratory (Controlled Area)(England & Wales)(No 3) Order 2001 which came into force on 16 March 2001.

3. EPIDEMIOLOGY

3.1 A diagram showing the believed epidemiological links between confirmed cases is shown at Annex 2.

3.2 It is believed that disease was first introduced into a pig-fattening unit in Northumberland (FMD 2001/04). From epidemiological investigations, it has been estimated that the earliest date for the introduction of virus to these holding was the 2nd February 2001.

3.3 From here, infected pigs were moved to an abattoir in Essex where the disease was first confirmed on 20th February (FMD 2001/01). By the time the source farm was identified, windborne spread of virus had infected cattle and sheep on nearby farms and some holding up to 8km distant.

3.4 The first holding in the Northumberland area that showed disease held both cattle and sheep (FMD 2001/06). Disease first became evident in cattle on these holdings on 23rd February, with no clinical signs in the sheep. Upon veterinary inquiry, it was found that sheep had been sold through local markets (Hexham, Northumberland and Longtown, Cumbria) during mid-February before FMD had been recognized in the UK. These sheep were either infected or incubating disease while at the market. They infected other animals within the markets and FMD was then distributed around the country by onward movement via markets, dealers and livestock vehicles.

3.5 The evidence from the epidemic to-date suggests that the widespread dissemination of disease in the sheep flock is continuing to cause disease outbreaks. Disease appears to be cycling unseen in flocks that were infected by movements before 23 February when a standstill on animal movements in Great Britain was first imposed.

3.6 A preliminary analysis of the animals held on FMD infected premises shows that the most common animals held are sheep and cattle (59%), sheep only (17%) and cattle only (12%). With time, the proportion of newly infected "sheep only" holdings has decreased and those with both sheep and cattle or cattle only has increased. The frequency of infection on holdings with sheep is greater than would be expected if all parts of the animal population were equally at risk. The majority of holdings infected are farms although dealers account for a small proportion of the total.

3.7 The proportion of holdings becoming infected due to local spread appears to have increased and that due to the movements of animals, people and vehicle movements has decreased.

3.8 Clusters of infection appear to be occurring with a large number of outbreaks occurring in defined geographical areas, notably in the Counties of Essex, Durham, Devon, Dumfries & Galloway and Cumbria. These appear to be due to a combination of movement related and local spread though overall, the movement related spread accounts for a notable proportion of outbreaks in these clusters.

Essex

3.9 A cluster of diseased holdings occurred around the abattoir in Essex (FMD 2001/01). Cattle and pigs were infected by personnel movements and contiguous spread. Two sheep holdings also showed disease and windborne spread or mechanical transmission by wild birds from the infected pig holding are being investigated as the possible means of introduction.

Durham

3.10 Disease was introduced into the County by infected sheep bought in markets by dealers. Longtown, Hexham and Darlington markets were implicated in these movements. Some of these sheep had disease diagnosed in an abattoir lairage where they infected pigs present already present in the abattoir. Windborne spread from the pigs,

local spread from contiguous holdings and within the 3km surveillance zones is thought to have been responsible for subsequent local spread to cattle and sheep.

Cumbria, Dumfries and Galloway

3.11 Longtown market had infected animals passing through it for 6 days before disease was first recognized in the UK. Infection was spread via the movement of infected sheep and sheep incubating disease. In addition, further spread occurred via contaminated livestock vehicles and mechanical transmission by people and equipment visiting the market. Epidemiological investigations indicate that further local spread then occurred by the movement of people, vehicles and other equipment in contact with both the market and the sheep

3.12 More cattle are becoming infected and may be acting as a source of infection, though this is thought to be a consequence of local spread and sheep are still the main source of introduction of infection into an area.

Devon

3.13 Infected sheep from Longtown market were moved into Devon by a dealer (FMD 2001/07) who then moved them between his other holdings in the area and county markets. His stockmen moved feed, hay and straw between the holding on vehicles. This may have spread contamination over the local roads in the area

4.14 Local farms have sheep and cattle. Many sheep are kept in groups away from the home farm so movements between them are numerous with many local roads in common use. These movements may have been responsible for the local spread following the original introduction of infection into the area. There were further movements of sheep and vehicles between different holdings and markets in the area and it is thought that the methods of local spread are similar to those in Cumbria although the initial weight of infection in the Devon area was much less.

Other areas

3.15 Other movements of sheep to abattoirs and markets throughout the UK have introduced disease into areas such as Wales, Scotland, Northamptonshire, Staffordshire, Worcestershire, Wiltshire and Gloucestershire. From this introduction local spread has occurred by means which vary according to the local farming methods in those areas.

3.16 In all new cases, sheep were the virus-introducing species and it is likely that disease is still circulating unnoticed in infected groups of sheep. It is thought that these sheep are still likely to cause disease in other more susceptible species, such as cattle, if either the sheep or contaminated people or equipment used among them, come into contact with them.

4. FUTURE DIRECTION OF CONTROLS

4.1 There are five key disease control aims.

- keep free of disease those areas of the country still free of FMD;
- halt the deteriorating disease situation in Devon;
- stop the spread of disease in the North of England and Southern Scotland;
- minimize the spread of disease from Longtown, Welshpool and Northampton markets;
- eliminate infection in flocks that have passed through dealers known to have handled infected animals.

Keep free of disease those areas of the country still free of FMD

4.2 It is anticipated that new types of control areas will be established aimed at avoiding the importation of FMD into these areas by the movement of animals from areas where infection exists. High risk movements of sheep which took place before 23 February into these areas will be identified and removed

Devon

4.3 Disease is occurring mainly in cattle and is easier to identify. The topography and farm structure (lots of small farms, dense animal populations, movements of people and vehicles) is not suited to a large scale preventive slaughter campaign, though individual farms or areas could be cleared on a case by case basis. The strategy will be to undertake intensive foot patrols in the 3-km area around infected farms with individual farms being visited by veterinary staff to ensure FMD cases are identified as early as possible to prevent onward spread.

Southern Scotland and Northern England

4.4 There is a large focus of infection in this area, mostly concentrated in sheep flocks, with the potential for rapid spread to adjacent holdings. It is proposed that all sheep and pigs within 3-km of an FMD infected holding should be killed. Symptoms of FMD are difficult to identify in sheep and the consequences of failure to identify infected sheep are greatest. In the case of pigs, there is a risk of substantial aerosol spread in the late stages of incubation before symptoms become apparent.

Summary Report Of Confirmed Cases

Situation at 26/03/2001 12:22

Spread of disease from Longtown, Welshpool and Northampton markets

4.5 There is clear evidence that sheep from markets in Welshpool, Longtown and Northampton markets were exposed to infection and there is reason to suspect that with the passage of time, numbers of flocks into which these sheep have been imported may be infected. These flocks will be killed as dangerous contacts.

Sheep that have passed through dealers known to have handled infected animals

4.6 Flocks associated with the movements of sheep handled during the high-risk period by two major dealers, may similarly be infected and will also be killed as dangerous contacts.
